## Emergency Medical Technician Psychomotor Examination Spinal Immobiliation (Supine Patient)

| Candidate: Examiner:   |                             |  |
|--|-----------------------------|--|
| Date: Start Time: End Time:  |                             |  |
|  |                             |  |
| Takes or Verbalizes appropriate body substance isolation Immobilization  | 1                           |  |
| Directs Assistant to place/maintain head in the neutral, in line position  | 1                           |  |
| Directs application of manual stabilization of the head  | 1                           |  |
| Reassesses motor, sensory, and circulatory functions of each extremity   | 1                           |  |
| Applies appropriately sized extrication collar   | 1                           |  |
| Positions the immobilization device appropriately  | 1                           |  |
| Directs movement of the patient onto the device without compromising the spine   | 1                           |  |
| Applies padding to voids between the torso and the device if necessary   | 1                           |  |
| Immobilizes the patient's torso to the device  | 1                           |  |
| Evaluates and pads behind the patient's head if necessary  | 1                           |  |
| Immobilizes the patients' head to the device   | 1                           |  |
| Secures the patient's legs to the device   | 1                           |  |
| Secures the patient's arms to the device   | 1                           |  |
| Reassesses motor, sensory, and circulatory functions of each extremity   | 1                           |  |
|  | TOTAL 14                    |  |
| You must factually document your rationale for checking any of the above critical items on this form   | (below or turn sheet over). |  |
| Did not properly apply appropriately sized cervical collar before ordering release of manual stabilization before it was maintained mechani.  Manipulated or moved the patient excessively causing potential for spinal compromist. Head immobilized to the device before device sufficiently secured to the torso. Patient moves excessively up, down, left, or right on the device. Head immobilization allows for excessive movement.  Upon completion of immobilization, head is not in a neutral, in line postion. Did not reassess motor, sensory, and circulatory functions in the injured extremity before and after splinting.  Failure to manage the patient as a competent EMT.  Exhibits unacceptable affect with the patient or other personnel.  Uses or orders a dangerous or inappropriate intervention. | cally                       |  |
