Introduction

Each year, the Health Statistics Branch, Arkansas Department of Health produces county level BRFSS estimates (Behavioral Risk Factor Surveillance System) that is calculated using the annual state level BRFSS survey data. The county estimates are uploaded to the ADH website as a PDF. Note that state percentages calculated using county totals may differ slightly from state-level BRFSS estimates.

Telephone numbers and zip codes are used to determine the number of responses to the state survey by county. Since the sample size for each county is based on telephone numbers, each county will be represented roughly in proportion to the number of residential telephone lines in that county. This results in wide variations in the number of interviews from each county. For example, Pulaski County—the largest in the state — may have 660 complete interviews in a particular year. On the other end, Lee County, which is much smaller, had only 18 interviews completed— too small for a reliable estimate. There are two ways to address this issue: 1) combine data for multiple years, or 2) combine data for adjacent counties. Statisticians at the Health Statistics Branch use data for single years and combines data from adjacent counties to get enough interviews to develop a reliable estimate. This method is used for all counties. Individual weights are developed for each county, and a SAS statistical analysis program is used to calculate the estimates for health risk factors for each of the counties in the state. 2021 county estimates used 2021 population estimates.
